# The National Context: Healthcare Restructuring and Integration of Mental Health and Primary Care

## • Important Federal Initiatives

- 2008: Mental Health Parity and Addiction Equity Act
- 2010: The Patient Protection and Affordability Care Act (PPACA)

## • Impact on States

1. Medicaid Managed Care
2. Concern with costly services, high end users, access
3. Growing involvement of consumers
4. Workforce shortages and task shifting
5. Health homes and care coordination
6. Data monitoring, EHRs
7. Quality measurement
8. Accountability and outcomes

# State Context: Fiscal Crises for State Mental Health Systems\*

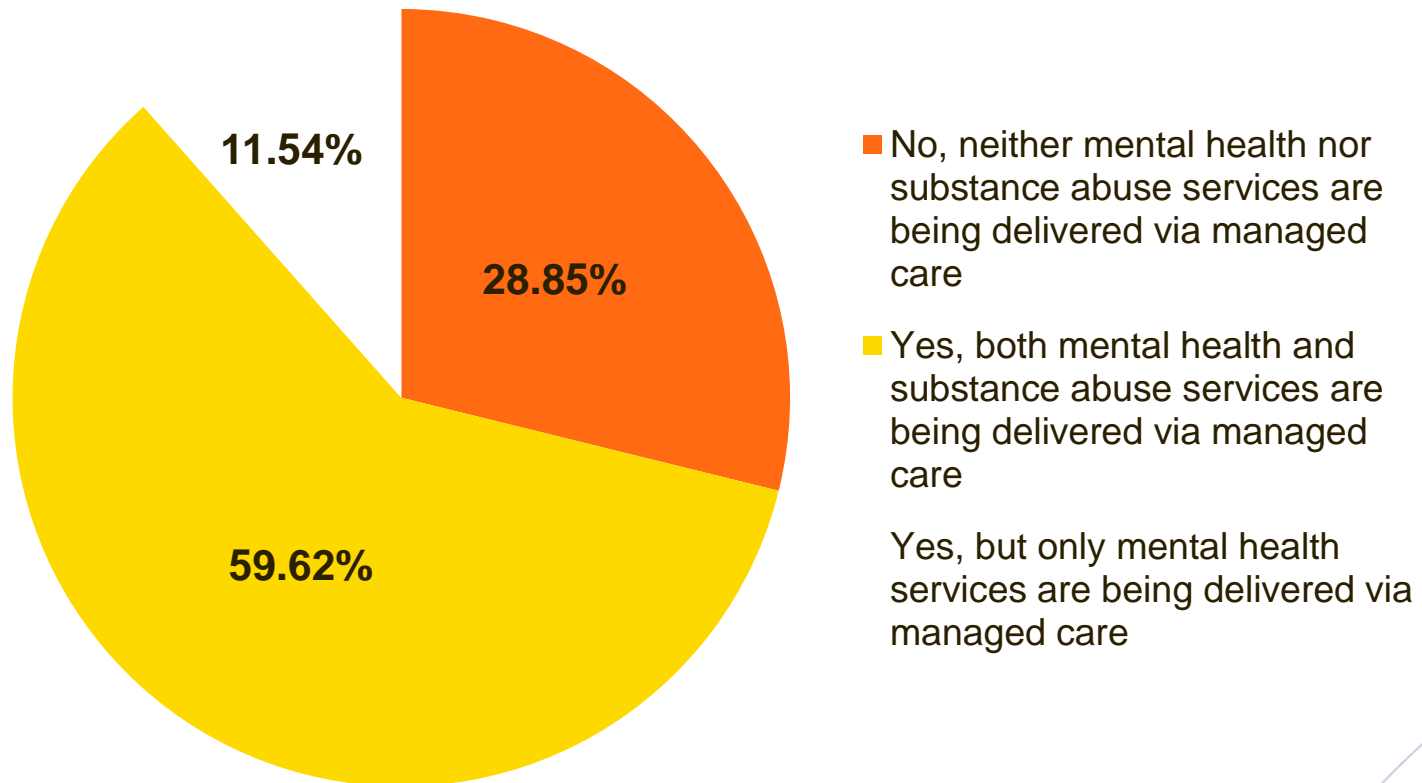

- Budget cuts (mainly State General Funds and Medicaid): FY09-FY12 totaling \$4.35 billion
- 76% of 47 state mental health agencies reported budget cuts in 2011;
- 73% of 47 state mental health agencies reported budget cuts in 2012
- State mental health agencies' response to budget cuts in 2011-12:
  - 24% reduced community mental health services
  - 27% reduced the number of clients served in the community
  - 39% reduced funds to community providers
  - 52% cut staff
  - 64% had hiring freezes
  - 82% reduced administrative expenses

children and families**

# Community Technical Assistance Center (CTAC)

**McSilver Institute**  
for Poverty Policy and Research  
NYU SILVER SCHOOL OF SOCIAL WORK

# Community Technical Assistance Center (CTAC)

(Hoagwood & McKay, Co-Directors)

**Goals:** Provide training, support, and quality improvement strategies to all NYSOMH licensed clinics (N=346) serving children and families by addressing both clinical and business needs.

**Funding:** New York State Office of Mental Health (2011-2016)

## • Type of Training

- ▶ Business improvement practices (Lloyd, 2012)
  - ▶ Open access
  - ▶ Centralized scheduling
  - ▶ Concurrent documentation
  - ▶ Volume and productivity
- ▶ Evidence-informed clinical practices
  - ▶ Engagement training (McKay et al., 2012) addressing no show rates
  - ▶ Multi-family Groups for Disruptive Behavior Disorders (Gopalan et al 2014; Chacko et al 2014)
  - ▶ Managing and Adapting Practice (MAP)

## • Intensity of training

- ❖ Webinar (*1 hour*)
- ❖ In-person training (*full-day*)
- ❖ Learning collaborative (LC; *year-long*)

# New York State Efforts to Improve Adoption

- **Achieving the Promise Initiative (2006)**

- \$62 million investment in children and family mental health services
- To improve delivery of, and access to, quality services

- **Child and Family Clinic Plus (2007-2009)**

- To target early detection of problems, linkage and access to services, and outreach
- Volume and spread: 39,000 screenings, 26,000 referrals, and 6,600 youth receiving in-home treatment

- **Evidence-based Treatment Dissemination Center (EBTDC) (2006-Present)**

- To provide clinical training and consultation to mental health professionals on using clinical EBPs
- Volume and spread: 1,300 clinicians and 300 supervisors trained to adopt clinical EBPs

# Adoption Study: Aims

- To expand knowledge about the adoption of innovations by characterizing adoption/uptake of CTAC offerings in New York State;
- To understand factors/characteristics (across multiple levels) that serve as facilitators and barriers to adoption; and
- To design interventions/approaches to improve the effectiveness and efficiency of state roll-outs of EBPs for children and families.

# Data Sources

## Outcome

- CTAC Attendance Data: Signing up & Showing up

## Predictors

1. U.S. DHHS Area Health Resources Files
  - County Demographic Data
2. NYSOMH Online Portal/CONCERTS
  - Up-to-date directory of licensed outpatient clinics
3. 2011 Consolidated Fiscal Report (CFR) system
  - Annual operational capacity and provider-level profiles
4. 2011 Patient Characteristics Survey (PCS)
  - Client profiles: % youth, % SED, % Medicaid

# Study #1: Characterize Adoption Patterns\*

- **Background:** Despite large-scale state efforts to roll out EBPs and QIs, measures of the adoption process are inconsistent and there are insufficient data to design future roll-outs
- **Aim:** Expand adoption definitions in existing literature beyond “yes/no” using NYS population of child mental health clinics
- **Approach:** Based on CTAC attendance data of the 346 clinics, adoption defined 4 ways:
  1. By **number** of trainings adopted
  2. By **intensity** of trainings adopted
  3. By **type** of trainings adopted
  4. By classifying clinics into **distinct adopter groups**:
    - ❖ **Low:** Webinar = Highest intensity adopted
    - ❖ **Medium:** In-person training = highest intensity adopted
    - ❖ **High:** 1 LC = Highest intensity adopted
    - ❖ **Super:** Both LCs = Highest intensity adopted

# 1. Number of Trainings Adopted

- 248 of 346 clinics adopted at least 1 training
- Mean = 4.8 trainings; median = 3 trainings

## 2. Intensity of Trainings Adopted Among Adopters

### 3. Type of Trainings Adopted Among Adopters

## 4. Adopter Groups

# Number of Trainings x Adopter Group

Number of Trainings Adopted	Adopter Group				Total	<i>p</i>
	Low	Medium	High	Super		
	n (%)	n (%)	n (%)	n (%)		
1-3	89 (80.2%)	33 (36.7%)	3 (7.7%)	0 (0.0%)	125 (50.4%)	<.001
4-7	20 (18.0%)	30 (33.3%)	16 (41.0%)	1 (12.5%)	67 (27.0%)	
8-17	2 (1.8%)	27 (30.0%)	20 (51.3%)	7 (87.5%)	56 (22.6%)	
Total	111 (100.0%)	90 (100.0%)	39 (100.0%)	8 (100.0%)	248 (100.0%)	

# Lessons Learned

- 1. Increasing sheer number of trainings unlikely to improve adoption**
  - Median = 3 trainings
- 2. Intensity and accessibility of trainings drive adoption preference**
  - Webinar uptake > In-person training uptake > Learning collaborative uptake
  - Trialability: Clinics that adopted an LC were likely to have sampled a webinar first
- 3. Business and clinical trainings are equally important to clinics' needs and viability**
  - Business vs. Clinical: Identical rate of uptake (75%)
  - Address climate of accountability and quality
- 4. Adopter groups communicate meaningful adopter profiles**
  - From low- to super-adopters, the continuum represents an increase in quantity and intensity of trainings adopted
- 5. States can develop different strategies for different goals of TA roll-outs**

# Conclusions:

- **Administrative data is useful in predicting *who* will participate, but less useful in predicting *level* of participation**
  - Administrative data are primarily structural
  - They lack more nuanced (e.g., provider attitudes) or local information (organizational culture/climate) that may influence clinic participation levels
- **Different levels of clinic characteristics were associated with Clinical vs. Business Practice Trainings**
  - *Business Practice* uptake associated with agency (affiliation, size, efficiency) and clinic provider profiles characteristics (outsourced clinical services)
  - *Clinical Trainings* uptake associated with clinic provider profile (clinical capacity) and client profile (% youth served)
- **Clinics make decisions based on relevant agency, provider and client factors (i.e., strategic fit and innovation-fit values)**

# Study #2: Measures for Predictors of Innovation Adoption (Chor et al., 2014)

- **Background**

- Adoption of innovation (e.g., EBP) precedes implementation and is an understudied, multi-faceted decision-making process
- Measurement literature tends to focus on implementation process
- State mental health systems, policy leaders, and service providers need decision-making guidance to selectively adopt sustainable, quality innovations and de-adopt ineffective practices.

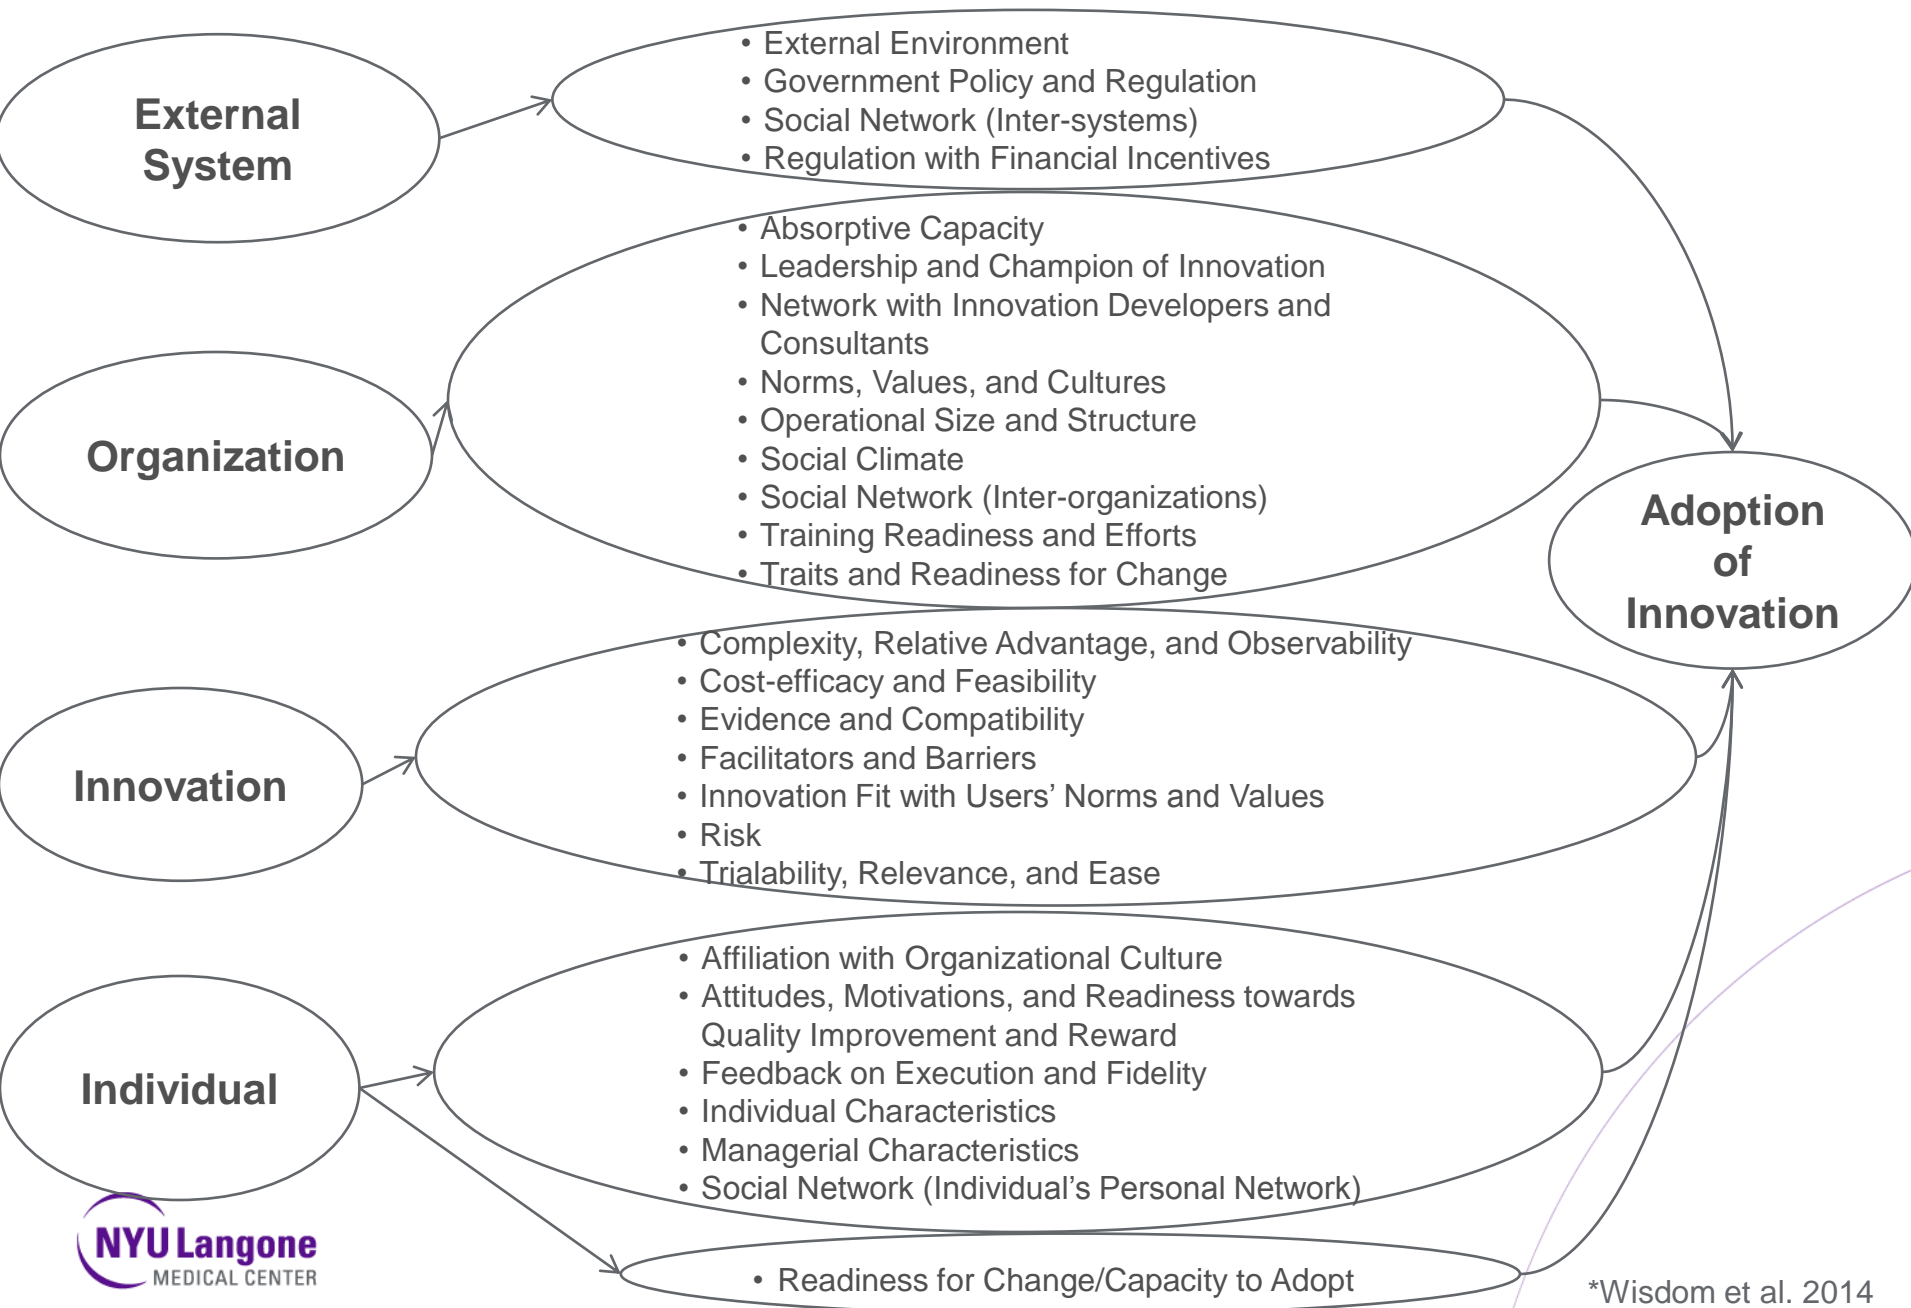

- **Aims**

- Build on a theoretical framework of predictors of innovation adoption (Wisdom et al. 2013) to **identify measures** associated with these predictors
- Highlight challenges of measurement
- Propose effective ways to integrate measures

# Steps to Identifying Measures for Adoption Predictors

- Begin with same pool of unique journal articles (n=322) that were originally screened to form the theoretical framework by Wisdom et al. (2014)
  - Database searches in Ovid Medline, PsycINFO, and Web of Science using combinations of specific Medical Subject Heading (MeSH) terms
  - E.g., “Adoption,” “Innovation,” “Evidence-Base,” “Model,” etc.
- Focus on measures championed by the theoretical framework
- Include additional measures from remaining articles in the original pool
- Include additional measures from snowball search of references of references
- Match measures to 27 adoption predictors based on relevance and 100% agreement among authors
- Code availability of psychometric properties, empirical adoption data, and whether the measured predictor is modifiable

# 27 Multi-Level Predictors of Innovation Adoption\*

# Results: 118 Measures by Level of Adoption Predictor

# Major Findings:

- Measures range from single/multi-item rating scales, multi-domain measures, to semi-structured or open-ended surveys.
- Measures applied in different fields: management, technology, public health, private sector, health, mental health, etc.
- Multi-dimensional organizational predictors (e.g., culture ,climate, readiness for change) require in-depth and diverse measures.
- Measures for same predictors (e.g., leadership) have rarely been compared to each other.
- Measures for related predictors (e.g., individual characteristics and perceived innovation characteristics) need to be considered to understand the related drivers of adoption.

# Study #3: Predictors of Adoption\*

**Background:** Factors that influence clinic responses to state-offered trainings have not been systematically examined.

**Aim:** Following a theoretical framework of adoption, we examined multilevel factors ranging from *organizational to client-level factors* that predict clinic responses to trainings.

***Business practices* vs. *clinical trainings* examined separately.**

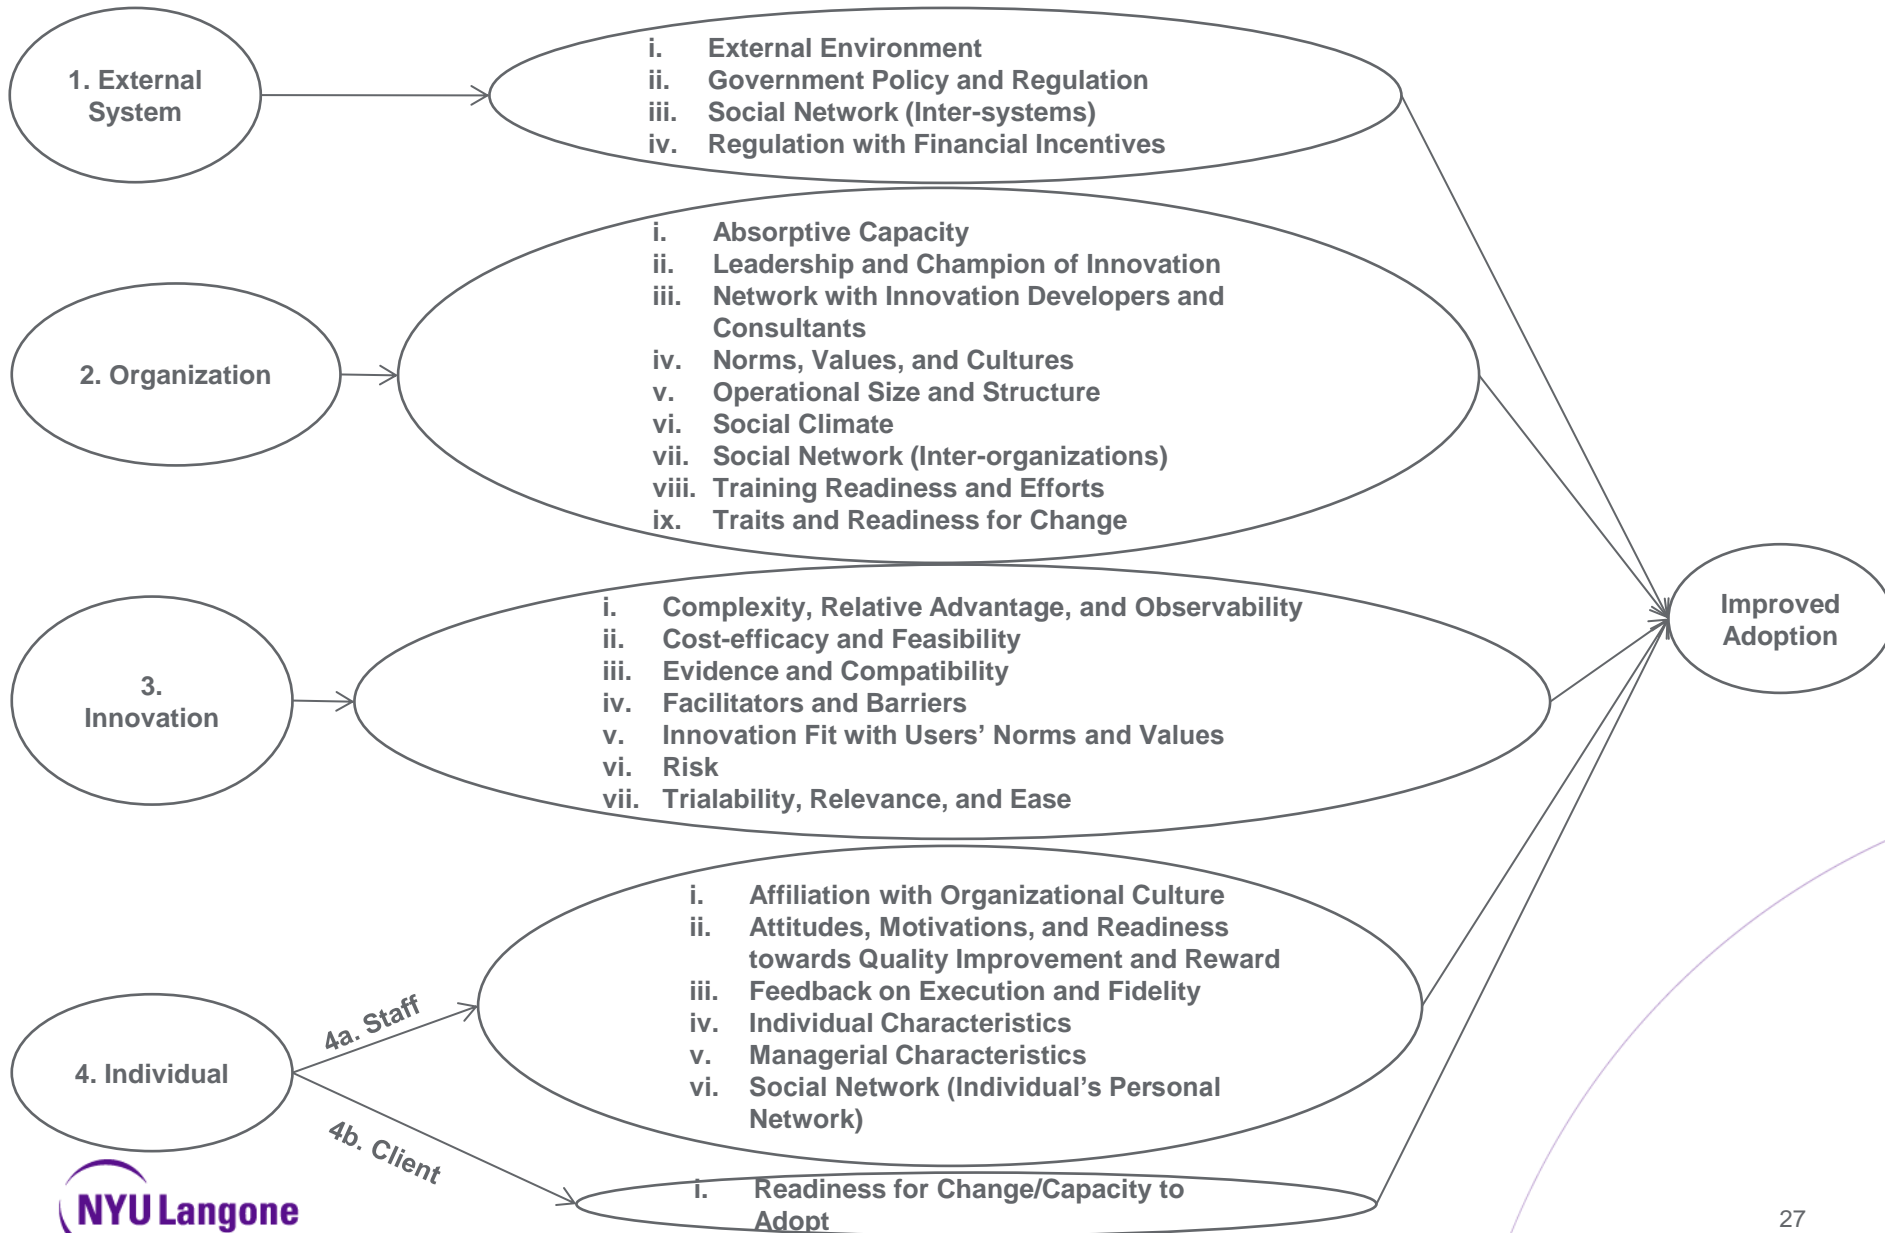

**Approach:** Based on clinic attendance data between September 2011-August 2013, adopter groups were created as follows:

- ❖ Adopter of any training (yes/no)
- ❖ Intensity of training participation among adopters (low/high)

Multiple logistic regression (adjusted odds ratios) were used to assess the independent effects of predictor variables on clinic training participation.

# Implications for State Systems

- State efforts to incentivize or target training efforts should pay attention to specific clinic characteristics available through administrative data
- To move clinics beyond adoption to successful implementation, targeting trainings to address both clinic needs and their readiness to change is critical
- Healthcare reform and new accountability standards make it imperative for States to understand and leverage factors that influence clinic decisions to embrace, implement and sustain improvement efforts.
- Important meta-message:  
State agencies can and should undertake theory-guided efforts to mine meaning from massive administrative data sets they have access to or manage to guide policy and program decisions.

# Adoption of Innovations: Publications to Date

## • THEORETICAL MODEL

- Wisdom JP, Chor KHB, Hoagwood K, Horwitz S (2014). Innovation Adoption: A Review of Theories and Constructs. *Administration and Policy in Mental Health and Mental Health Services Research*, 41, (4): 480-502.

## • MEASUREMENT OF CONSTRUCTS

- Chor KHB, Wisdom JP, Olin SS, Hoagwood KE, Horwitz SM (2014). Measures for Predictors of Innovation Adoption. *Administration and Policy in Mental Health and Mental Health Services Research*. Apr 17. Epub ahead of print.

## • ADOPTION BEHAVIOR

- Chor KHB, Olin S, Weaver J, Cleek A, McKay M, Hoagwood K & Horwitz SM (2014). Characterizing clinic adoption of clinical and business trainings in child mental health in New York State. *Psychiatric Services*, 65(12), 1439-1444.

## • ADOPTION PREDICTORS (QUANTITATIVE)

- Olin SS, Chor KHB, Weaver J, Duan N, Kerker B, Clark L, Cleek AF, Hoagwood KE, Horwitz SM (in press). Multilevel Predictors of Clinic Adoption of State-Supported Trainings. *Psychiatric Services*.

## • ADOPTION PREDICTORS (QUALITATIVE)

- Clinic/Agency Director Interviews (N=60); State Policymaker Interviews (N=9). Palinkas et al. In preparation.
